AI-Assisted Daily Task Manager SPA

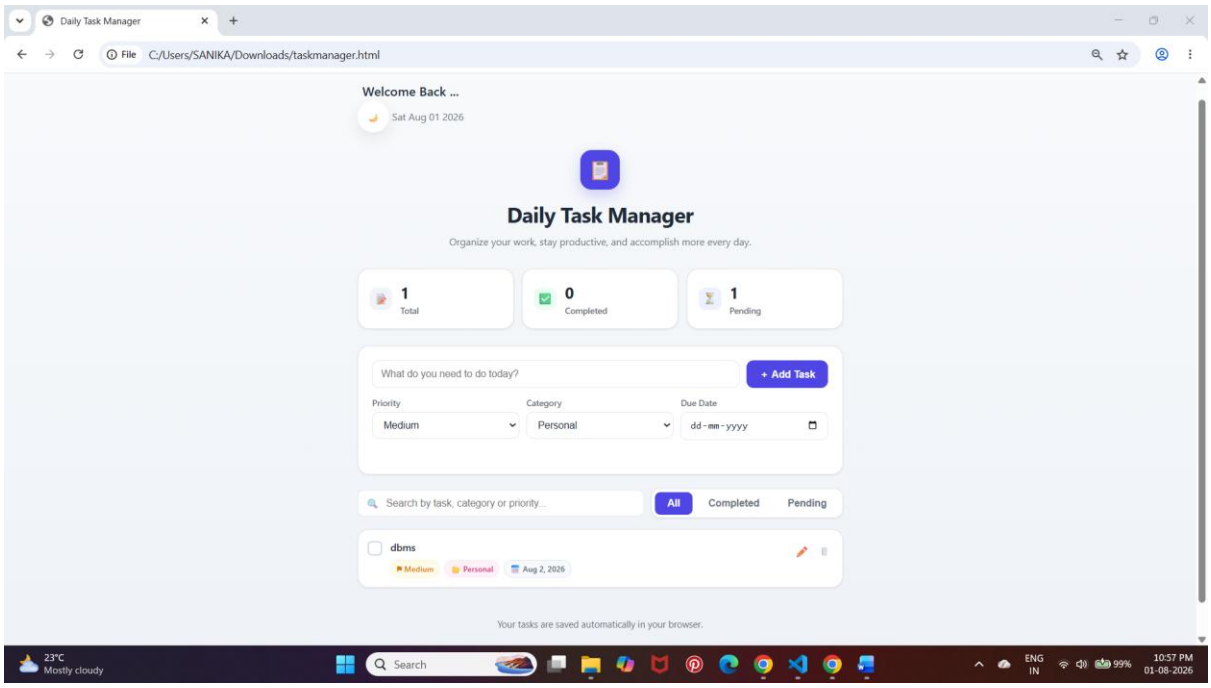

I built a **Daily Task Manager** using **HTML, CSS, and JavaScript**. The purpose of this project is to help users organize their daily tasks in a simple and easy way.

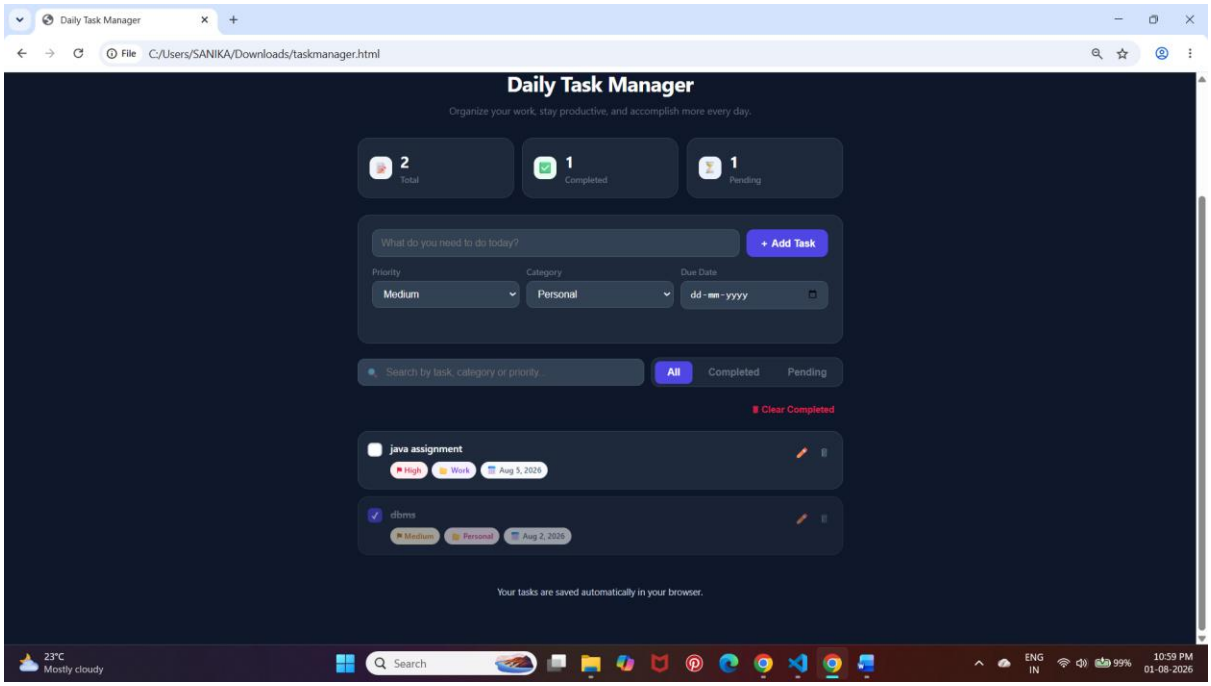

The application allows users to add, edit, delete, and mark tasks as completed. It also includes task filtering (All, Completed, and Pending), a search bar, task priority, category, due date, task counters, and a clear completed button. Tasks are automatically saved in the browser using Local Storage, so they are not lost after refreshing the page.

I also added a responsive design, progress bar, dark mode, and a confirmation dialog before deleting tasks to improve the user experience.

One challenge I faced was making sure the task list and counters updated correctly after every action. I solved this by updating the task list whenever a task is added, edited, completed, or deleted.

This project helped me improve my frontend development skills and understand how to build an interactive web application.
