Project Overview

This project is a responsive Student Enquiry CRM Dashboard developed using **HTML, CSS, and JavaScript**. The dashboard fetches student information from the JSONPlaceholder API and transforms it into realistic student enquiry records by assigning courses, enquiry dates, follow-up dates, enquiry status, and notes. Users can search for students, view detailed information, and generate AI-assisted follow-up summaries. The dashboard provides a clean and user-friendly interface suitable for educational organizations.

Why AI Adds Value

The **AI-assisted Follow-up Summary** feature was selected because admission counselors frequently need to contact prospective students with personalized messages. Writing professional follow-up notes repeatedly can be time-consuming and inconsistent. This feature automatically generates concise and relevant follow-up summaries using the student's course, enquiry status, and notes. AI improves efficiency by reducing repetitive work, maintaining consistent communication, and helping staff focus on engaging with students rather than writing routine messages. In this project, mock AI logic is used instead of a real AI model, so the summaries are predefined rather than dynamically generated. Despite this limitation, the feature effectively demonstrates how AI can enhance CRM workflows and improve productivity.

How API Data is Used

The dashboard retrieves student information from the public **JSONPlaceholder Users API**.

API Endpoint: https://jsonplaceholder.typicode.com/users

The API provides basic user information such as name, email, and phone number. Since the API is not specifically designed for a CRM system, additional CRM-related fields including interested course, enquiry date, follow-up date, enquiry status, and notes are generated dynamically using JavaScript. This approach simulates realistic student enquiry records while demonstrating successful API integration.
